Efforts to Reduce the Volume and Toxicity of the Waste Generated:

This waste is hazardous by application of 40 CFR 261.3(c)(2)(I). The sludge generated from our facility contains 40% – 65% silica and calcium, which are necessary raw materials for cement manufacturing. The Lafarge and St. Marys facilities use this material as a raw material in their cement manufacturing process. Therefore, the material has a beneficial use as opposed to land filling.

Efforts to reduce the volume of the originally generated wastes prior to incineration are reported in the facility Hazardous Waste Reduction Plan that will be updated by July 1, 2012 in accordance with New York regulations and the facility Hazardous Waste Management Permit. Data is not available prior to 1984 for comparison.

Certification:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

2012-11-26 USEPA Info Req - 2011 Export Rpt.pdf 2011 Annual Export Report_ammended 01-08-13.pdf

Dear Mr. Nelson,

Thank you for taking the time today to discuss this matter with me. As we discussed, Momentive had submitted the 2011 Annual Export Report on March 1, 2012, however due to a clerical error, the report was mailed to the incorrect address. Per your guidance, I have revised the 2011 Annual Export Report to reflect the correct EPA address and have attached a pdf copy for your files. It is my understanding that this electronic submittal will meet the requirements of the US EPA information request that Momentive received on 11/26/12.

Please let me know if you need any additional information.

Thank you,
Kirsten Pink
